1 Basic solving with Cholesky

Solving a linear least-squares system:

$$\arg\min_{x} \|Ax - b\|^2$$

Set derivative equal to zero:

$$0 = 2A^T (Ax - b)$$
$$0 = A^T Ax - A^T b$$

For comparison, with QR we do

$$0 = R^{T}Q^{T}QRx - R^{T}Qb$$
$$= R^{T}Rx - R^{T}Qb$$
$$Rx = Qb$$
$$x = R^{-1}Qb$$

But with Cholesky we do

$$0 = R^{T}RR^{T}Rx - R^{T}Rb$$
$$= R^{T}Rx - b$$
$$= Rx - R^{-T}b$$
$$x = R^{-1}R^{-T}b$$

2 Frontal (rank-deficient) solving with Cholesky

To do multi-frontal elimination, we decompose into rank-deficient conditionals.

$$R^T S = F^T G$$
$$S = R^{-T} F^T G$$

$$S^TS + C^TC = G^TG$$

$$G^TFR^{-1}R^{-T}F^TG + C^TC = G^TG$$

$$G^TQRR^{-1}R^{-T}R^TQ^TG + C^TC = G^TG$$
 if R is invertible, $G^TG + C^TC = G^TG$
$$C^TC = 0$$
